## **Morphological Image Processing-part1 2023**

# Morphological Image Processing

- ◆ Morphological image processing is a collection of non-linear operations related to the shape or morphology of Objects in an image; Morphology is a broad set of image processing operations that process images based on shapes.
- ◆ Morphological techniques can be used for removing imperfections of regions in binary images such as those caused by noise, texture or inaccurate thresholding.
- ◆ Thinning in edge detection, Region filling, Edges-Linking are some important examples
- ◆ Morphological techniques are usually applied to Binary images (edges, boundaries, etc.) but can also be applied to grayscale images (Top-Hat Transform)

# Some Uses of Mathematical Morphology

- ◆ image enhancement
- ◆ image segmentation
- ◆ edge detection
- ◆ skeletonization
- ◆ shape analysis
- ◆ curve filling
- ◆ general thinning
- ◆ corner detection
- ◆ Deep morphological networks ☺

## Abstract

Mathematical morphology provides powerful nonlinear operators for a variety of image processing tasks such as filtering, segmentation, and edge detection. In this paper, we propose a way to use these nonlinear operators in an end-to-end deep learning framework and illustrate them on different applications. We demonstrate on various examples that new layers making use of the morphological non-linearities are complementary to convolution layers. These new layers can be used to integrate the non-linear operations and pooling into a joint operation. We finally enhance results obtained in boundary detection using this new family of layers with just 0.01% of the parameters of competing state-of-the-art methods.

*Keywords:* Mathematical Morphology; deep learning; edges detection; denoising.

---

## 1. Introduction

Modern deep learning approaches learn parameters of a series of linear and non-linear operators for a given task. The concatenation of these operators over multiple layers increases the depth thereby generalization power of neural networks. Similar to previous works [1, 2], our paper tries to incorporate new types

morphological processing

# Morphological Operations

## Some Morphological Operations

### 1- The Basic Operations:

- Erosion.
- Dilation.

### 2- The Compound Operations:

- Opening and Closing.

### 3- More Advanced Operations:

- Hit-and-Miss Transform.
- Thinning and thickening
- Corner Detection
- Region Filling
- Top-Hat Transform

# Erosion

- Erosion 'shrinks' or 'thins' objects in a binary image.
- The manner and extent of shrinking is controlled by a structuring element.

- Structuring element:

1	1	1
1	1	1
1	1	1

Set of coordinate points =

{ (-1, -1), (0, -1), (1, -1),  
(-1, 0), (0, 0), (1, 0),  
(-1, 1), (0, 1), (1, 1) }

# Structuring Element

A structuring element is a small image – used as a moving window

Example Structuring Elements

Structuring Elements converted to rectangular arrays

# Structuring Element

For simplicity we will use rectangular structuring elements with their origin at the middle pixel

1	1	1
1	<b>1</b>	1
1	1	1

0	1	0
1	<b>1</b>	1
0	1	0

0	0	1	0	0
0	1	1	1	0
1	1	<b>1</b>	1	1
0	1	1	1	0
0	0	1	0	0

# Structuring Elements: Hits & Fits

Structuring Element

**Fit:** All *pixels* in the structuring element cover *pixels* in the image

**Hit:** Any *pixel* in the structuring element covers a *pixel* in the image

All morphological processing operations are based on these simple ideas

# Structuring Elements: Hits & Fits

Consider each foreground pixel in the input image. If the structuring element fits in, write a “1” at the origin of the structuring element.

$$s_1 = \begin{pmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{pmatrix}$$

$$s_2 = \begin{pmatrix} 0 & 1 & 0 \\ 1 & 1 & 1 \\ 0 & 1 & 0 \end{pmatrix}$$

		A	B	C
fit	s <sub>1</sub>	yes	no	no
	s <sub>2</sub>	yes	yes	no
hit	s <sub>1</sub>	yes	yes	yes
	s <sub>2</sub>	yes	yes	no

Hit: intersect the image in some pixels

# Erosion: !! تآكل

- The **erosion** of a binary image  $f$  by a structuring element  $s$  (denoted  $f \ominus s$ ) produces a new binary image  $g = f \ominus s$  with ones in all locations  $(x,y)$  of a structuring element's origin at which that structuring element  $s$  completely *fits* the input image  $f$ .
- The structuring element  $s$  is positioned with its origin at  $(x, y)$  and the new pixel value is determined using the rule:

$$g(x, y) = \begin{cases} 1 & \text{if } s \text{ fits } f \\ 0 & \text{otherwise} \end{cases}$$

# Erosion – How to compute

Erosion with a structuring element of size 3x3

# Erosion- How to compute

# Erosion

## ◆ Effects

- Shrinks the size of foreground (1-valued) objects
- Smooths object boundaries
- Removes small objects

# Erosion: Example 1

# Erosion: Example 2

Original  
binary  
image  
*circles*

Erosion  
by 11x11  
structuring  
element

Erosion  
by 21x21  
structuring  
element

Erosion  
by 27x27  
structuring  
element

# Erosion

Erosion can split apart joined objects

Erosion can strip away extrusions

**Watch out:** Erosion shrinks objects

# Exercise

Count the number of coins in the given image

# Exercise: Solution

Binarize the image

Perform Erosion

Use connected component labeling to count the number of coins:  
Do in the Lab `cv2.connectedComponentsWithStatsWithAlgorithm`

# Dilation: !! تمدد

- **Dilation** has the opposite effect of erosion.
- It 'grows' or 'thickens' objects in a binary image.
- As in erosion, this is controlled by the structuring element.

1	1	1
1	1	1
1	1	1

Set of coordinate points =

{ (-1, -1), (0, -1), (1, -1),

(-1, 0), (0, 0), (1, 0),

(-1, 1), (0, 1), (1, 1) }

# Dilation

- The dilation of an image  $f$  by a structuring element  $s$  (denoted  $f \oplus s$ ) produces a new binary image  $g = f \oplus s$  with ones in all locations  $(x, y)$  of a structuring element's origin at which that structuring element  $s$  *hits* the input image  $f$  in at least one location.
- The structuring element  $s$  is positioned with its origin at  $(x, y)$  and the new pixel value is determined using the rule:

$$g(x, y) = \begin{cases} 1 & \text{if } s \text{ hits } f \\ 0 & \text{otherwise} \end{cases}$$

# 1-D Dilation Example

**Solution:**

	1	0	1	1	1	1	1	1	
--	---	---	---	---	---	---	---	---	--

# Dilation

## ◆ Effects

- Expands the size of foreground objects
- Smoothing object boundaries
- Closes holes and gaps

# Dilation: Example

*Effect of dilation using a  $3 \times 3$  square structuring element*

# Dilation: Example 1

Original image

Dilation by 3\*3  
square structuring  
element

Dilation by 5\*5  
square structuring  
element

**Note:** In these examples a 1 refers to a black pixel!

# Dilation: Example 2

Original (178x178)

dilation with  
3x3 structuring element

dilation with  
7x7 structuring element

# Dilation: Example 3

Historically, certain computer programs were written using only two digits rather than four to define the applicable year. Accordingly, the company's software may recognize a date using "00" as 1900 rather than the year 2000.

**Historically, certain computer programs were written using only two digits rather than four to define the applicable year. Accordingly, the company's software may recognize a date using "00" as 1900 rather than the year 2000.**

0	1	0
1	1	1

**FIGURE 9.5**  
(a) Sample text of poor resolution with broken characters (magnified view).  
(b) Structuring element.  
(c) Dilation of (a) by (b). Broken segments were joined.

# Dilation

Dilation can repair breaks

Dilation can repair intrusions

**Watch out:** Dilation enlarges objects

# Compound Operations

- ◆ More interesting morphological operations can be performed by performing combinations of erosions and dilations

The most widely used of these *compound operations* are:

- **Opening:** *Erosion followed by Dilation*
- **Closing:** *Dilation followed by Erosion*

# Opening and Closing

- Derived from the fundamental operations of Dilatation and Erosion.
- Opening and closing are dual operations (the closing of  $X$  corresponds to the opening of  $X^c$ )
- **Opening and Closing are idempotent: repeated application has no further effects.**

## Opening:

- Similar to Erosion.
- Used mainly for **spot and noise removal**.
- However, it is **less destructive** than erosion.
- Opening is defined as an **Erosion, followed by a Dilatation** using the **same structuring element** for both operations.

# Opening

- Take the structuring element (SE) and slide it around inside each foreground region.
- All foreground pixels which can be covered by the SE with the SE being entirely within the foreground region will be preserved.
- All foreground pixels which can not be reached by the structuring element without lapping over the edge of the foreground object will be eroded away!
- **Example: Structuring element: 3x3 square**

# Opening examples

Opening with a 11 pixel diameter disc:

3x9 and 9x3 Structuring Element

So it can be used to  
search for a specific  
shape: e.g. Car Plate

# Closing

## Closing:

- Similar to Dilation – used for **removal of holes** and **region filling**
- Closing is defined as a **Dilatation, followed by an Erosion** using the **same structuring element** for both operations.
- Take the structuring element (SE) and slide it around outside each foreground region.
- All background pixels which can be covered by the SE with the SE being entirely within the background region will be preserved.
- All background pixels which can not be reached by the structuring element without lapping over the edge of the foreground object will be turned into a foreground.

# Closing example

Example: structuring element: 3x3 square

# Another closing example

Closing operation with a 22 pixel disc, closes small holes in the foreground.

# And another...

Threshold, closing with disc of size 20.

Note that opening is the **dual** of closing i.e. opening the foreground pixels with a particular structuring element is equivalent to closing the background pixels with the same element.

# Opening followed by closing example

- Opening removes the noisy spots in the fingerprint image. However, numerous gaps are introduced in the ridges of the fingerprint.
- These are filled in by the closing operation
